Example Project Description

Agentic AI for Audit – External Driver Researcher

Sponsor Organisation: DBS Bank	**Sponsor Coordinator: [Wei WU, Ella NGIAM]**	**Project Mentor: Huayu Wu, Wei Wang**
Business Domain: Internal Audit The internal audit function in banks provides independent assurance on governance, risk management, and controls. Auditors need to review significant number of documents and data (structured or unstructured) in fieldwork. The sponsor seeks an Agentic solution to assist auditors in the end to end process.	**Project Description:** Build an agentic solution to research and synthesizes regulatory and industry developments across locations on a given topic (e.g AML, Cyber, Data etc), and produces a comprehensive report including: A. Regulatory development • Monitor regulatory announcements, consultation papers, guidelines, enforcement actions, and policy updates from regulators across selected markets. • Identify new, amended, or upcoming regulations relevant to the chosen topic. • Summarize key regulatory requirements and obligations in business-friendly language. • Highlight effective dates, implementation timelines, and compliance deadlines. • Assess the potential impact on the organization, including risks, opportunities, and required actions. • Compare regulatory developments across jurisdictions and identify common themes and regional differences. • Track regulatory trends and emerging supervisory focus areas. • Provide source references and links to original regulatory publications for verification. B. Industry developments • Monitor industry news and publications, track major market events, incidents, and case studies related to the selected topic. • Identify emerging trends, best practices, and innovations adopted within the industry.	**Project Inputs:** • List of sample topics to focus on • Based on internet data
Problem Statement: The rapidly evolving regulatory and industry changes makes manual monitoring inefficient and difficult to scale. An AI-powered agentic solution can streamline intelligence gathering, improve awareness of emerging developments, and support proactive decision-making.		**Project Deliverables:** • Develop an AI-powered agentic solution with an intuitive user interface that enables users to: • Select a topic (e.g., AML, Cybersecurity, Data Privacy). • Define jurisdictions/regions of interest. • Generate a structured report summarizing relevant regulatory and industry developments. • Implement a multi-agent workflow to autonomously research, analyze, synthesize, and consolidate information from authoritative sources. • Incorporate robust guardrails to ensure: • Factual accuracy and source-grounded responses with traceability back to source. • Completeness and comprehensive coverage of selected jurisdictions and topics. • Detection and mitigation of hallucinations or unsupported claims.
